SUMMARY

Software engineer passionate about building scalable software systems and solving real-world problems. Experience spans backend development, AI-powered applications, blockchain technologies, and developer platforms, with a strong focus on designing reliable, maintainable, and production-ready software.

PROJECTS

WarrantyVault – Decentralized Warranty Management *Feb – Mar 2026*

🔗 <https://github.com/Arunkumar7070/WarrantyVault>
<https://warranty-vault-6311.vercel.app>

- **What it does:** A decentralized application (dApp) that replaces traditional paper warranties with secure, tamper-proof digital records stored on the Base Sepolia blockchain.
- **Functionality:** Users connect a MetaMask wallet to register a warranty on-chain via the `WarrantyRegistry.sol` smart contract, verify its status anytime, transfer ownership peer-to-peer, and store the original invoice permanently on IPFS through Pinata.
- **Tech Stack:** Solidity, Hardhat, Ethers.js, FastAPI, Web3.py, MongoDB Atlas, React, TypeScript, Pinata/IPFS.

DocuFlow – Backend SaaS for Document Processing *Oct – Nov 2025*

🔗 <https://github.com/Arunkumar7070/DocuFlow>
<https://docuflow-9smq.onrender.com/docs>

- **What it does:** A backend-as-a-service platform that lets developers upload documents and automatically extract text from them via OCR, without managing their own processing infrastructure.
- **Functionality:** A user uploads a file and instantly gets back a tracking job ID while OCR runs in the background on Celery workers; they can then poll job status, retrieve extracted text, and authenticate as either a human user (JWT) or a developer (hashed API key), all served from a Redis-cached, PostgreSQL-backed API.
- **Tech Stack:** Python, FastAPI, Celery, Redis, PostgreSQL, SQLAlchemy (Async), Alembic, Docker, Cloudinary, PyTesseract.

QueryWhisper – AI Natural-Language-to-SQL Engine *May – Jun 2025*

🔗 <https://github.com/Arunkumar7070/Querywhisper>
<https://querywhisper-pgft.onrender.com>

- **What it does:** A web application that lets users query a database using plain English instead of writing SQL themselves.
- **Functionality:** A user types a question in natural language; the app reads the connected database's live schema, generates the correct SQL for that specific engine (MySQL, PostgreSQL, SQLite, or SQL Server) via the Groq LLaMA-3.3-70B model, and executes it – restricting write operations (INSERT/UPDATE/DELETE) to admin accounts only.
- **Tech Stack:** Flask, LangChain, Groq API (LLaMA-3.3-70B), SQLAlchemy, MongoDB, Docker.

ACHIEVEMENTS

- Serving as the Coordinator of Hall and Media for departmental events, managing logistics and promotions effectively.
- National Cadet Corps (NCC) B-certificate: Developed discipline and teamwork skills.
- Active Department member – Conducted various events in college.

EDUCATION

Integrated M.Sc. Software Systems **2022 – Present**
PSG College of Technology, Coimbatore *CGPA: 7.01/10.0*

XII (State Board) **2022**
SSV Matric. Hr. Sec. School, Erode *89.16%*

X / SSLC (State Board) **2020**
SSV Matric. Hr. Sec. School, Erode *80.20%*

AREAS OF INTEREST

Blockchain • Database Management Systems • Data Structures & Algorithms • Backend Development

SKILL SET

■ Languages

Python, C++, JavaScript, SQL, Solidity

■ Platform

Windows, Linux

■ Tools & Frameworks

Git, MATLAB, VS Code, React, Flask, FastAPI

■ Database

MySQL, MongoDB

WORK EXPERIENCE

SDE Intern

Elsa

Jun 2025 – Dec 2025

Elsa – Crypto Copilot

Contributed to the development of an AI-powered crypto wallet using Next.js, Django, and MySQL. Implemented ENS domain registration, integrated the Sui blockchain for wallet operations and transaction management, worked on yield and staking features supporting validator management, reward claiming, and multi-position staking, and integrated Surge USDC Yield via smart contract interactions to enable decentralized yield generation.

Elsa CLI – AI-Powered Blockchain Terminal Client

Worked on the Elsa CLI using TypeScript and Node.js for AI-assisted on-chain operations through natural language commands. Implemented secure wallet integration and extended the existing API pipeline by adding transaction functionalities such as Send, Swap, Bridge, and Hyperliquid operations. Integrated existing APIs and multi-chain support to enable seamless transaction execution across multiple networks.

EightyFive – AI-Powered Polymarket Trading Agent

Worked on an AI-powered trading agent that automates prediction market operations on Polymarket. Integrated embedded wallet functionality with AWS Bedrock AgentCore to enable secure blockchain interactions and nano-payment workflows.
